

## Which video formats do we accept?

Most of the existing video formats are supported.

SWISSTRAFFIC.ai is capable of processing **most of the existing video encoding formats** including MP4, AVI, MPEG, WMV, etc. The system also supports most of the existing video codecs such as H.262, H.263, H.264, other MPEG-4 video codecs, etc.

For the best results, upload the video **in the original format** with framerate around **25 FPS**. Videos with resolution below 512x512 are not supported. For interlaced videos (PAL), we recommend to deinterlace the video before uploading to achieve the highest accuracy (to do this, you can use ffmpeg).

Not sure how to capture suitable video for automatic video analytics? Read our guide on how to record a suitable video for video analytics from drones or from standard cameras.
